STRATEGIC THESIS

ELEMENTS TO STRATEGY

PRIVATE AND CONFIDENTIAL

Elements of our Strategy

THE CORE

Core Purpose:

“To improve people’s lives by getting the whole world moving.”

Core Values:

1. Pull Your Weight - Stretch

Individuals are accountable for their output and results. Work through challenges rather than passing work to others or expecting teammates to carry you. Pull your own weight, take initiative, ask for help, and don’t sidestep your responsibilities.

2. Listen and Learn - Absorb

People deserve to have their time and effort acknowledged. Absorb information, learn from those around you, and recognize contributions to show you value others’ time. Listen actively, keep learning, and acknowledge the people helping or working alongside you.

3. Family First - Balance

Both personal family and “company family” matter—it’s about balancing the give and take. Sometimes one will take priority over the other; when you step away, be prepared to step back in and do what’s needed so the team doesn’t lose ground because of your absence.

Living These Values

These core values define who we are and how we work together. They guide our decisions, shape our culture, and determine how we treat each other and our work. Every team member is responsible for embodying these values daily.

Core Competency:

1. Adaptive Algorithm Intelligence

The ability to build, maintain, and continuously evolve a proprietary algorithm that combines a physio-informed database of 6,700 plus poses - organized across 16 root positions, 26 directions, and progressive hold times - with individual user filters including time, goal, body part, position, incorporating their complete stretch history, to generate a routine that is uniquely constructed for each user at each session. This is the competency that no competitor can replicate without rebuilding the foundational database and the adaptive algorithm logic from the ground up.

2. Physio-Informed Content Development

The ongoing capability to source, validate, and integrate expert movement knowledge — from physios, rehab specialists, and credentialed practitioners — into a proprietary front-end database that is designed for rapid, structured expansion. This competency ensures the algorithm is only as intelligent as the expertise feeding it, and that the pose library continuously grows in depth and clinical credibility ahead of any competitor attempting to replicate it.

3. Translating Science Into Simplicity

The capability to take the full complexity of the algorithm and database and translate it into an avatar-guided, step-by-step experience that is built by ICPs for ICPs - ensuring that the product is designed from the user's perspective at every development decision, and that the interface remains effortless regardless of how sophisticated the underlying science becomes. This competency is what connects the technology advantage directly to the ease-of-use brand promise.

Core Competency Map

STRATEGIC THINKING:

1. Words We Own (Elevator Pitch – What do you do?):

WeStretch owns three phrases that, used consistently across every customer touchpoint, should become instinctively associated with our brand and our brand alone:

- **"Evolves with you"** - our brand position. It captures the compounding, adaptive nature of every routine and is only credible if the algorithm behind it is real. No competitor can claim it honestly without matching our technology.
- **"Physio-informed"** - our credibility anchor. It signals that the intelligence driving every pose is grounded in expert knowledge, not generic programming, and raises a bar competitors must visibly meet before they can use similar language.
- **"Step-by-step"** - our experience promise. It tells the user that regardless of the complexity behind their routine, their only job is to follow the next clear instruction. It appears consistently across our purchase criteria, value proposition, and brand promises — and that repetition is what turns a descriptor into owned language.

2. **First Strategic Objective supporting the Strategic Thesis (End point and time frame that is a single SMT goal):**

3. **Sandbox (scope)**

i. **Core customer:**

- a. **WHO:** Busy active older adults (aged 50+) losing mobility, and experiencing some pain and stiffness
- b. **WHAT:** Convenient, at home, and easy expert-developed stretching programs tailored to individuals needs

Ideal Customer Profile:

Busy, active adults aged 50+ noticing reduced mobility and experiencing some pain and stiffness, seeking an easy to use, expert-designed at-home stretching program tailored to their mobility needs.

Where (Scope/Domain): Worldwide

Vertical Integration: *What we won't offer or where we will not go:*

- A yoga app.
- A pre-recorded stretching library.
- A timer-based stretch list.
- A beginner-to-advanced template progression.

4. **Advantage: Value Proposition Graphs** (The Key values the customer gets by dealing with our company):

Value Proposition Statement (*why buy from us*):

Customer-Facing Version:

WeStretch gives busy active adults noticing reduced mobility, stiffness, or pain a safe, physio-informed stretching program that's effortless to follow. Unlike anything else, it builds and adapts a routine that's uniquely yours. Based on your goals, your body, your time, and your stretch history, every session is built specifically for you — not from a preset program you picked, but from what your body needs today and what you've already done, so your routines continue to evolve with you.

Internal/Alignment Version:

WeStretch wins by owning three advantages that, together, competitors cannot match: every user's program is safe by design — driven by an algorithm built on physio expertise that ensures every pose delivered is the right pose, at the right time, for the right need; this complexity is presented to the user through an avatar delivering clear, step-by-step instructions; and every stretch is used to individually build a unique routine and continuously adapted to each person's goals, body, time, and stretch history. Every decision we make — what we build, what we improve, and what we choose not to do — should protect and deepen our advantage in these three areas."

5. Brand Promise

- I. **Expertise-Driven** - Every pose you receive has been determined by physio-informed intelligence to be the right pose, for your body, at that moment.
- II. **Effortlessly Guided** - No matter how complex the science behind your routine, your experience is always a clear, simple next step.
- III. **Uniquely Yours** - Your routine is never borrowed from someone else — it is built and continuously adapted to you alone.

Kept Promise Indicators:

1. Expertise-Driven

- A qualified physio or movement expert reviews and validates every new pose added to the database before it is made available to users – *leading indicator*
- Zero reported injuries or adverse physical reactions attributable to a WeStretch-prescribed pose – *lagging indicator*

2. Effortlessly Guided

- A new user completes their first full session without requiring any support, tutorial, or help intervention – *leading indicator*
- User feedback consistently rates instruction clarity at or above a defined satisfaction threshold – *lagging indicator*

3. Uniquely Yours

- No two users with different profiles, histories, or goals receive the same routine on the same day – *leading indicator*
- A returning user's routine measurably changes over time in response to their stretch history — tracked and verifiable within the app – *lagging indicator*

Sweet Spot:

6. Key to making money – One-PHRASE (*What our competitive game will be/or ADVANTAGE. Defines how we will drive profits and tells us what customer desire we will meet and which to ignore*)

“Owning the intersection of clinical expertise and individual personalization at the price of an app”

WeStretch competes in a white space between two existing markets: the expensive, inaccessible world of in-person physio and professional movement coaching, and the cheap, generic world of YouTube videos and one-size-fits-all fitness apps. Neither market serves the ICP well - one is too costly and inconvenient, the other lacks the expertise and personalization that produces real results.

WeStretch drives profit by making physio-informed, individually adaptive stretching available at an accessible app price point - a combination that neither end of the market can replicate without fundamentally changing their cost structure or technology capability.

What this means we will focus on:

- ⇒ Continuously deepening the clinical expertise and algorithm intelligence that justifies the customer's trust and ongoing subscription
- ⇒ Keeping the experience effortless so the price-to-value perception remains unambiguous for the ICP
- ⇒ Growing retention over acquisition - the longer a user stays, the more adapted their program becomes and the harder the product is to replace with a cheaper alternative.

What this means we will deliberately ignore:

- ⇒ Users seeking a free or one-time purchase solution
- ⇒ Group or class-based stretching experiences
- ⇒ Customers who are not motivated by expert-backed credibility and are satisfied with generic programming

Flywheel – How we will scale/strengthen our company

The WeStretch Flywheel

Expert credibility builds user trust, user trust grows the platform, platform growth makes the algorithm smarter, a smarter algorithm produces personalization that delivers visible results, visible results create advocates, and advocates attract more experts.

Steps:

a) Expert Contribution and Validation

When more experts - physiotherapists, rehab specialists, and credentialed movement practitioners - contribute to the algorithm database or validate the exercises being used, it directly increases user trust. An expert-validated platform removes the uncertainty an ICP feels when trying a new health and wellness app, and that trust converts into a higher likelihood of download, subscription, and continued use.

b) Grow Active User Base

As expert credibility drives more users to the platform, the active user base grows in both size and diversity. A larger, more varied user base means the platform accumulates a richer volume

of individual stretch histories, goals, body profiles, and usage patterns — all of which feed directly into the algorithm.

c) Smarter, More Adaptive Algorithm

The growing depth and diversity of user data, combined with ongoing expert input, makes the algorithm progressively smarter and more adaptive. It becomes better at determining the right pose, for the right person, at the right time - and more capable of building routines that are genuinely unique to each individual.

d) Deeper Personalization Per User

A smarter algorithm delivers routines that are genuinely unique to each individual and that visibly change as the user progresses. Because the algorithm knows the user's specific routines and how long they have been stretching on the platform, making improvements visible allows users to track how far they have come - and to see and experience measurable, felt improvements in mobility, stretching ability, and pain reduction over time. These are results no generic app can replicate, because no generic app knows what this platform knows about them.

e) Natural Advocates

Users who experience real results become natural advocates. They rate the app highly in the App Store, share their experience with others, and endorse the platform in the communities where the ICP lives - whether online, in social groups, or through word of mouth. This advocacy drives new user acquisition without relying solely on paid channels.

f) More Experts Want to Associate

A platform with a growing base of vocal, results-driven users and strong App Store credibility becomes an attractive association for experts. Physiotherapists and movement specialists are more willing to contribute, validate, and publicly recommend a platform that is demonstrably producing outcomes for real users - and that expert re-engagement feeds new knowledge and credibility back into the database.

And the flywheel turns again.

7. Our Differentiating Activities (3 to 5 specific actions that represent HOW we will execute) that our competitors won't or can't do without great effort, and how we will deliver on our customer value proposition. [need to expand]

- I. xxx
- II. xxx
- III. xxx

Activity Map: [to be expanded]

Core customer: XXX

"This activity map captures the key activities within the company that our competitors won't or can't do without great effort, and how we will deliver on our customer value proposition."

8. **X- Factor** (The unique, secret advantage that will give us a massive, defensible lead that will give us a 10x (or greater) edge over competitors):

"From Adaptive to Generative: A Platform That Thinks with You" - The algorithm that currently adapts to the user becomes an algorithm that converses with the user - transforming WeStretch from a personalized delivery platform into an intelligent interactive movement companion.

Today, the WeStretch algorithm adapts automatically - responding to a user's filters, pose history, hold times, and cumulative engagement to build a routine that is uniquely theirs. This is already a defensible advantage that no competitor can replicate without rebuilding the foundational database and adaptive logic from the ground up.

The X-Factor is the next evolution of that capability: a generative algorithm that allows the user to actively shape their own experience through conversation and higher-tier customization. Rather than the platform deciding everything on the user's behalf, the user can interact with the platform - asking questions, indicating what they felt, flagging what is or is not working, and requesting adjustments - and the algorithm responds intelligently, within the boundaries of the physio-informed database, to refine the next session accordingly.

This shifts the platform's value proposition from "we know what you need" to "we know what you need, and we listen when you tell us something has changed"

Why this is a 10x advantage:

- ⇒ It makes the platform functionally impossible to replace - a user's conversational history and self-reported feedback become part of their data asset, compounding the switching cost beyond stretch history alone.
- ⇒ It opens higher-tier subscription pricing justified by a genuinely differentiated feature that no generic app can offer at this level of clinical credibility
- ⇒ It accelerates the flywheel - generative interactions produce richer user data, which makes the algorithm smarter, which deepens personalization, which produces better results, which creates more advocates.
- ⇒ It positions WeStretch at the intersection of stretching science and AI-driven personalization - a white space that will only grow in strategic importance as consumers expect more intelligent, responsive health platforms.

The condition for this advantage to hold: The generative layer must remain anchored to the physio-informed database. The algorithm can only converse credibly because the intelligence behind it is clinically grounded — without that foundation, the feature becomes indistinguishable from any AI chatbot. The database is the moat; the generative capability is the drawbridge.

9. Profit X – our Economic Engine.

xxxx

10. BHAG:

[to be completed]

Strategy Statement (Objective/Value Prop/Core Customer/How): [to be added]

Back up:

Core Competencies:

Technology: developing an algorithm database that generates using selected time, goal, body part filters, position filters, and complete stretch history to adapt a routine to be customize for the individual

Additional poses research gathered from experts for rehab exercises incorporate into the app

All stretches and exercises are put into an avatar

Use of avatar – developed by an algorithm (uses Unity development tool) - as an exercise companion that changes for each user to produce individual exercises. The avatar will more specific based on the specific algorithm.

App is created by ICP's for ICP's

Nimble in prioritizing development initiatives

Physio developed original database with 4500 poses to develop individual posing ie. there could be up to 16 root positions (understanding the principles of neuro threading) to work on stretching the neck in 26 directions. Therefore there 416 different poses, also the technology will progress in hold times as the stretch is repeated by the user. Started with one joint one direction. Cumulative poses were added to the data base later.

Continue to review online physio and other experts to continue to incorporate new poses

Front end propriety database that allows for easy input to add more poses.
